DEFINE THE PROBLEM STATEMENT

Project: Script-Controlled ACL District Record Access in ServiceNow

This project focuses on implementing Script-Controlled Access Control Lists (ACLs) in ServiceNow to restrict access to district records. The system ensures that users can only view, create, update, or delete records belonging to their authorized district while administrators retain full control.

Customer Problem Statement - PS1

I am	A ServiceNow System Administrator
I'm trying to	Control access to district records securely
But	Different users require different levels of access
Because	Sensitive district data must be protected from unauthorized access
Which makes me feel	Concerned about security, compliance, and access management

Problem Analysis

Manual permission assignment increases the risk of human error, unauthorized access, and administrative overhead. A district-based access control mechanism is required to automate security decisions and enforce organizational policies.

Customer Problem Statement - PS2

I am	A District-Level User
I'm trying to	Access records that belong to my district
But	I should not be able to access records from other districts
Because	District information is confidential and must be protected
Which makes me feel	Dependent on a secure and reliable access-control system

Stakeholders

- ServiceNow Administrators
- District Users
- Security Auditors
- Organization Management

Key Challenges

- Unauthorized record access
- Managing permissions across multiple districts
- Maintaining compliance and audit requirements
- Reducing manual administration effort

Final Problem Definition

How can ServiceNow implement a script-controlled ACL mechanism that restricts access to district records based on user roles and district assignments, ensuring that only authorized users can perform Read, Create, Update, and Delete operations while maintaining security, compliance, and administrative efficiency?

Expected Benefits

- Improved district-level security
- Automated access control decisions
- Reduced administrative workload
- Better compliance and auditing
- Protection of sensitive district records

Selected Solution

Script-Controlled ACL with District-Based Access Validation in ServiceNow.
